

Logical Map How-to Guide

Scott H., System Analyst

2025-03-11

Overview

As we face quickly changing systems, knowing how to create a logical map is critical. There are many existing tools that help with this. I distill down to the quickest and most effective methods, combining material and data flow with just three symbol classes and two types.

Making Sense of Material and Data Flow

Civilization is moving fast. Our progress is causing damage to ourselves and the biosphere ([Greenspoon et al. 2023](#)) . The explosive growth of data involved in modern experience, coupled with the extremely complex global supply chain of materials and energy, means that participating in design, operations and governance is overwhelming and unlikely for most. We feel like we are participating. We ask questions about when we will arrive. We make demands of the driver for comfort, entertainment, bathroom breaks and reassurance. We add sensors and artificial intelligence to the car as it continues on its destructive path. We have so much invested, and are moving so fast, that we are stuck as passengers. Rather than an identifiable driver, we ask the **car** where to go and what to do. The automobile companies tell us we don't need maps. We just need to subscribe to a car service, and it will provide answers about the journey. Our free journey app is a frictionless experience as we accelerate on our destructive journey. As we mature, we begin to question the whole idea of progress, the reason for our journey ([Project 2024](#)) .

The most effective way to change complex systems is through ideology and culture, rather than tweak and primp the car and sensors ([Meadows 1999](#)) . Culture cradles us, and provides more direction than our real-time cognition ([Tomasello et al. 2005](#)) ([Zheng and Meister 2025](#)) . It is unlikely we can change while the car is moving. Luckily for us, business-as-usual is not sustainable. There will be pauses in motion as parts of our complex system collapses, emerges, and collapses again with varying cadence. During the pauses between collapse and emergence, we will have opportunities to change. A map can help us make sense of the journey, and establish where we are, where we want to go, and how to get there. Triple System Analysis ([3sA](#)) and Adaptive Analysis () explain how to use multi-level maps to understand systems ([H. 2023b](#)) ([H. 2024](#)) . This how-to guide () builds on those ideas, but constrains the map to necessary functional elements of material and data flow like Fig. 1.

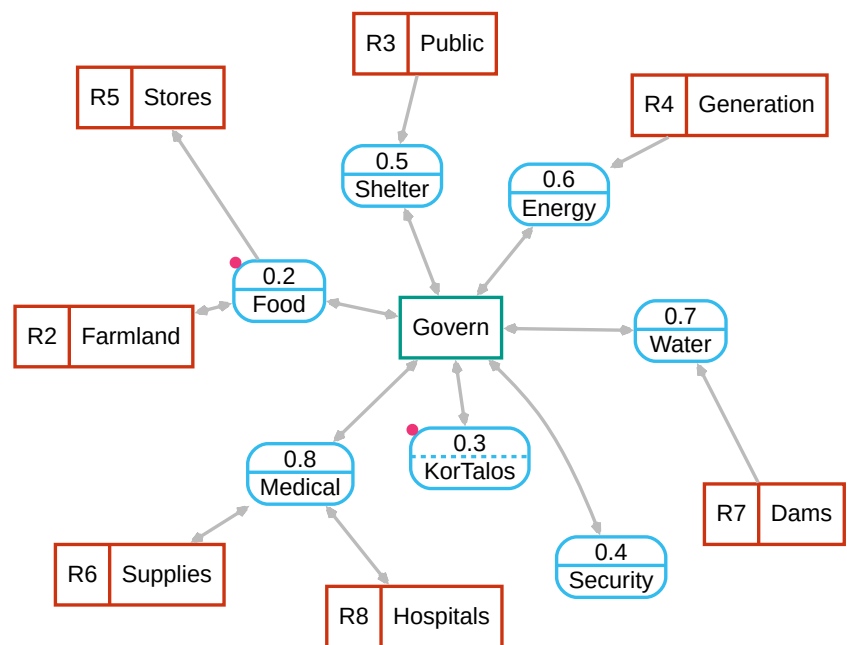

Figure 1: Top

Scope of This Paper

I don't pretend that maps will solve our problems, or detail what culture and ideology will be needed to refactor and change our systems. Others have explored these issues in the context of our immediate crises ([Hagens 2022](#))  ([TEDx Talks 2023](#))  ([Oguzcan 2021](#))  ([John Vervaeke 2023](#))  ("[Huxley - Wallace](#)" 1958) . I do have professional experience creating logical data flow maps as part of system analysis ([H. 2023a](#)) . I have leveraged that experience and focused on extending to material and data flow in a simple way, and will limit the rest of that paper to that scope.

Data

Data might live on index cards at a library, a computer hard disk, as memories of childhood, or shared cultural forms in our dreams ([Samson et al. 2023](#)) . Data flows in our daily lives as we run reports, write in our diary, account for money, message our friends, maintain contacts, and many other things that rely on other services to process and store our data. Those services rely on others. Restaurants often require data flow to accept customers, as orders and payment are handled by external services. When there is a network interruption, business grinds to a halt. Data flow maps were introduced in the 1970s to analyze complicated data processing, and were proven to be an effective cognitive aid ([Gane and Sarson 1977](#)) .

Materials, Services and Energy

Supply chains of production and distribution of materials like eggs, steel, mobile phones or lettuce can also cause significant disruption when interrupted. Energy is routed much like materials, and in many cases is directly related to materials ([Levi and Cullen 2018](#)) .

Map Key

The rounded rectangle blue nodes are transformations. The teal rectangle nodes are agents that are the sources or sinks of data or intelligence. The reddish-brown nodes store data or materials at rest. Dotted lines within the node represent data. Solid lines represent materials. As I explained in , data flow diagrams are behind agents that operate transforms. This is why I think it is OK to mix the nodes, as most of the function is behind the screens, the black box of the device or report that assists the transform. Magenta dots in the corner of a transform/process node mean the node can be expanded by clicking. An orange dot means that notes and narrative will show with a pointer hover. A blue dot in the lower right corner of a material transform means there is a connection to the associated full data flow.

Map Presentations

Simple Web

Let's start with the graph stack format introduced in  to create the graph in Fig. 1. I'm going to assume that you can use NPM, or, at least can bribe a programmer with a beverage and food to help you ("[Node.js — an Introduction to the Npm Package Manager](#)" n.d.) . We will continue to build out more sophisticated features, but for now, create a blank directory, cd into it, and install text-model-dot, gsdot-svg, and http-server with NPM:

```
1 $ npm install text-model-dot gsdot-svg http-server
2 added 101 packages in 3s
```

We now have a new directory called node_modules which contains the software. It is also possible to go directly to the repository on GitHub and download the software, but getting used to NPM will help us later on ([H. 2025](#)) . Create a file named index.html in the directory with this content:

```
1 <!DOCTYPE html><html lang="en"><title>Top</title>
2 <div id="map"></div>
3 <script type="module">
4   import { model_to_dots } from "../node_modules/text-model-dot/text-model-dot.js"
```

```
5   import { gsdot_svg } from "./node_modules/gsdot-svg/dist/gsdot-svg.bundle.js"
6   async function main() {
7       const model = await (await fetch('./node_modules/text-model-dot/example.txt')).text()
8       const dot_lines = model_to_dots(model).dots["Top"];
9       await gsdot_svg(dot_lines, 'default', 'map');
10  }
11  main()
12 </script></html>
```

Start up a web server to see the graph:

```
1  $ npx http-server
2  Starting up http-server, serving ./
3
4  http-server version: 14.1.1
5
6  http-server settings:
7  CORS: disabled
8  Cache: 3600 seconds
9  Connection Timeout: 120 seconds
10 Directory Listings: visible
11 AutoIndex: visible
12 Serve GZIP Files: false
13 Serve Brotli Files: false
14 Default File Extension: none
15
16 Available on:
17   http://127.0.0.1:8080
18 Hit CTRL-C to stop the server
```

Browse to <http://127.0.0.1:8080>, and you'll see a graph like Fig. 1.

Road Trip Toolkit

Local Documentation

The map is generated via JavaScript, CSS, and HTML. Spin off a project right now to understand how to run documentation locally. This can be done by running a local version of MDN Web Docs (“[MDN Web Docs](#)” n.d.) [↗](#). As of this writing (2025-03-09), the way I do it is I fork content and yari as parallel repositories. (Note that there are some instructions that say to install yari as a subdirectory of content). Then run:

```
1 yarn install
2 yarn dev
```

To update later, change to the local repository and run:

```
1 git pull origin main
2 yarn
3 yarn dev
```

Going forward, just use `yarn start`. Browse to `http://localhost:3000` to see a local MDN. Test by disconnecting from the Internet.
